UnWrap Crack For Windows

---

## UnWrap

UnWrap is a lightweight and user-friendly application designed to help you clean up pieces of text copied from an email that are difficult to read due to prefixes and symbol characters. The software aims to resolve the problem that occurs when you try to insert an email to a text document and it automatically pastes with unwanted characters. Return lines, prefixes or brackets encumber the text and make it troublesome for user reading. Simple imports UnWrap identifies the original message and re-writes the text, without the unwanted elements. You can paste the lines automatically when you click on the UnWrap button, if the text is copied to clipboard. Otherwise, you can

---

import a TXT file and let the program extract the message from its content. The application displays the plain text in the lower box and optionally you can export it to a pre-selected document. Re-writing texts

The program identifies certain tags, such as Message sent, Subject or To, that can be customized, depending on the syntax used by the email service. Optionally, you can chose to remove blank spaces, tab spaces or a specified character, like parentheses, commas, curly brackets, Trademark signs or other symbols. UnWrap can apply alternating text formatting rules regarding the line returns: it can keep or remove all returns and it can delete isolated line-returns while keeping double consecutive line-returns a new paragraph.

Additionally, it can delete all returns in columns greater than a specified

---

value. You may choose which of these protocols you want to apply to your text. When encountering multiple spaces, the program can collapse them all to a single space, as well as align the lines by translating the tabs to a certain value of spaces.

Conclusion UnWrap is a useful application for text cleansing, capable of trimming unwanted characters at the beginning of the lines or deleting line-returns and replacing them with spaces. The program can also format a text by creating the correct line endings and number of rows.

application displays the plain text in the lower box and optionally you can export it to a pre-selected document. UnWrap also identifies certain tags, such as Message sent, Subject or To, that can be customized, depending on the syntax used by the email service. Optionally, you can chose to remove blank spaces, tab spaces or a specified character, like parentheses, commas, curly brackets, Trademark signs or other symbols. UnWrap can apply alternating text formatting rules regarding the line returns: it can keep or remove all returns and it can delete isolated line-returns while keeping double consecutive line-returns a new paragraph.

Additionally, it can delete all returns in columns greater than a specified value. You may choose which of these protocols you want to apply to your text. When encountering

---

multiple spaces, the program can collapse them all to a single space, as well as align the lines by translating the tabs to a certain value of spaces. Furthermore, you can change line endings: "br" and "nl" will be changed into "br"; "cr" and "lf" will be changed into "cr". 17 Comments I tried UnWrap and it works. It detected and removed all the prefixes and symbol characters from the lines. It gave the original text in a different format, but it was also good. I'm a big fan of your work, and I like your new features. Keep up the good work. Only negative comment: It doesn't seem to detect all prefixes and symbols, such as the anchor character, I don't know if there's a reason for that. Thanks for your comment. Yes, the application is only able to detect the anchor characters in addresses. This is a

---

limitation of this application. In addition, the application detects only the "" word so far, this is a possible limitation of this application. It is not a limitation of the software. There is a bug in the application.
