Q: Evaluation of a function with a polar argument I'm trying to evaluate the following function at the point  $x=0$ :  $\frac{1}{4}(x^2-2x\sin x)\sqrt{x^2-x\sin x+\cos x}$  but Mathematica and Maple gives me a pair of complex numbers.  $\frac{3\pi}{\sqrt{2}}$  and Maple says "Undefined". Is there something wrong with my calculation, or is there something wrong with the function itself? A: You could try replacing the radical with an expression that can be evaluated using  $\sqrt{x^2 - 2x \sin x}$  or  $\text{Simplify}[\sqrt{x^2 - 2x \sin x}]$  (which both yield the same result) and simplify your expression using that. in Beirut, something that triggers an incredible reaction. Interviewer: Beirut is a war zone now. People here are scared of the terrorists. Is that why your heart sank? D'Alessandro: I knew what to expect, so that was kind of a relief. But the amount of security that you see on the street is mind-boggling. You see so many more police. This is a city where, back in the day, you could walk around and, for the most part, feel safe.
