Real-time axial and helical coronary magnetic resonance angiography: comparison with conventional coronary angiography. This study compared the diagnostic accuracy of real-time axial and real-time helical coronary magnetic resonance angiography (MRA) with that of conventional coronary angiography (CCA) for the detection of stenosis  $\geq 50\%$ . In 17 patients, coronary MRA was performed with real-time axial and real-time helical methods (simultaneous imaging of 18 cm of the coronary tree), both together and independently (first-pass imaging). CCA was performed by conventional methods. All patients were examined using a whole-body MR scanner. The examinations were performed using a two-dimensional breath-hold segmented gradient-echo sequence. Coronary MRA was compared with CCA. The prevalence of coronary disease was 87%. Compared with CCA, real-time MRA had a sensitivity of 96% (95% confidence interval [CI]: 82-99%) and a specificity of 100% (95% CI: 85-100%) for the detection of  $\geq 50\%$  stenosis, and a sensitivity of 94% (95% CI: 75-99%) and a specificity of 97% (95% CI: 80-99%) for the detection of  $\geq 75\%$  stenosis.
